

INTRO TO PYTHON FOR DATA SCIENCE

Hello Python!

What you will learn

- Python
- Specifically for Data Science
- Store data
- Manipulate data
- Tools for data analysis

How you will learn

Python

- Guido Van Rossum
- General Purpose: build anything
- Open Source! Free!
- Python Packages, also for Data Science
 - Many applications and fields
- Version 3.x - <https://www.python.org/downloads/>

IPython Shell

Execute Python commands

 DataCamp

< Course Outline >

Calculations with variables

100xp

Remember how you calculated the money you ended up with after 7 years of investing \$100? You did something like this:

```
100 * 1.10 ** 7
```

Instead of calculating with the actual values, you can use variables instead. The `savings` variable you've created in the previous exercise represents the \$100 you started with. Up to you to create a new variable to represent `1.10` and then redo the calculations!

Instructions

- Create a variable `factor`, equal to `1.10`.
- Use `savings` and `factor` to calculate the amount of money you end up with after 7 years. Store the result in a new variable, `result`.
- Print out the value of `result`.

 [Take Hint \(-30xp\)](#)

script.py

```
1 # Create a variable savings
2 savings = 100
3
4 # Create a variable factor
5
6 # Calculate result
7
8
9
10 # Print out result
```

INTRO TO PYTHON FOR DATA SCIENCE

Variables and Types

Variable

- Specific, case-sensitive name
- Call up value through variable name
- 1.79 m - 68.7 kg

```
In [1]: height = 1.79
```

```
In [2]: weight = 68.7
```

```
In [3]: height
```

```
Out[3]: 1.79
```

Calculate BMI

```
In [1]: height = 1.79
```

```
In [2]: weight = 68.7
```

```
In [3]: height
```

```
Out[3]: 1.79
```

```
In [4]: 68.7 / 1.79 ** 2
```

```
Out[4]: 21.4413
```

```
In [5]: weight / height ** 2
```

```
Out[5]: 21.4413
```

```
In [6]: bmi = weight / height ** 2
```

```
In [7]: bmi
```

```
Out[7]: 21.4413
```

$$\text{BMI} = \frac{\text{weight}}{\text{height}^2}$$

Reproducibility

 my_script.py

```
height = 1.79
weight = 68.7
bmi = weight / height ** 2
print(bmi)
```

Output:
21.4413

Reproducibility

 my_script.py

```
height = 1.79
weight = 74.2 ←
bmi = weight / height ** 2
print(bmi)
```

Output:
23.1578

Python Types

```
In [8]: type(bmi)
Out[8]: float
```

```
In [9]: day_of_week = 5
```

```
In [10]: type(day_of_week)
Out[10]: int
```

Python Types (2)

```
In [11]: x = "body mass index"
```

```
In [12]: y = 'this works too'
```

```
In [13]: type(y)
```

```
Out[13]: str
```

```
In [14]: z = True
```

```
In [15]: type(z)
```

```
Out[15]: bool
```

Python Types (3)

```
In [16]: 2 + 3  
Out[16]: 5
```

Different type = different behavior!

```
In [17]: 'ab' + 'cd'  
Out[17]: 'abcd'
```

INTRO TO PYTHON FOR DATA SCIENCE

Let's practice!

INTRO TO PYTHON FOR DATA SCIENCE

Python Lists

Python Data Types

- `float` – real numbers
- `int` – integer numbers
- `str` – string, text
- `bool` – `True`, `False`

```
In [1]: height = 1.73
```

```
In [2]: tall = True
```

- Each variable represents single value

Problem

- Data Science: many data points
- Height of entire family

```
In [3]: height1 = 1.73
```

```
In [4]: height2 = 1.68
```

```
In [5]: height3 = 1.71
```

```
In [6]: height4 = 1.89
```

- Inconvenient

Python List

[a, b, c]

```
In [7]: [1.73, 1.68, 1.71, 1.89]
```

```
Out[7]: [1.73, 1.68, 1.71, 1.89]
```

```
In [8]: fam = [1.73, 1.68, 1.71, 1.89]
```

```
In [9]: fam
```

```
Out[9]: [1.73, 1.68, 1.71, 1.89]
```

- Name a collection of values
- Contain any type
- Contain different types

Python List

[a, b, c]

```
In [10]: fam = ["liz", 1.73, "emma", 1.68, "mom", 1.71, "dad", 1.89]
```

```
In [11]: fam
```

```
Out[11]: ['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
```

```
["liz", 1.73]  
["emma", 1.68]  
["mom", 1.71]  
["dad", 1.89]
```

Python List

[a, b, c]

```
In [10]: fam = ["liz", 1.73, "emma", 1.68, "mom", 1.71, "dad", 1.89]
```

```
In [11]: fam
```

```
Out[11]: ['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
```

```
In [11]: fam2 = ["liz", 1.73],  
                ["emma", 1.68],  
                ["mom", 1.71],  
                ["dad", 1.89]
```

```
In [12]: fam2
```

```
Out[12]: [['liz', 1.73], ['emma', 1.68],  
          ['mom', 1.71], ['dad', 1.89]]
```

List type

```
In [13]: type(fam)
Out[13]: list
```

```
In [14]: type(fam2)
Out[14]: list
```

- Specific functionality
- Specific behavior

INTRO TO PYTHON FOR DATA SCIENCE

Let's practice!

EXERCISE

Different ways of importing

There are several ways to import packages and modules into Python. Depending on the import call, you'll have to use different Python code.

Suppose you want to use the function `inv()`, which is in the `linalg` subpackage of the `scipy` package. You want to be able to use this function as follows:

```
my_inv([[1,2], [3,4]])
```

Which `import` statement will you need in order to run the above code without an error?

INSTRUCTIONS 50 XP

Possible Answers

- ☐ `import scipy` press 1
- ☐ `import scipy.linalg` press 2
- ☐ `from scipy.linalg import my_inv` press 3
- ☐ `from scipy.linalg import inv as my_inv` press 4

IPYTHON SHELL

EXERCISE

Blend it all together

In the last few exercises you've learned everything there is to know about heights and weights of baseball players. Now it's time to dive into another sport: soccer.

You've contacted FIFA for some data and they handed you two lists. The lists are the following:

```
positions = ['GK', 'M', 'A', 'D', ...]
heights = [191, 184, 185, 180, ...]
```

Each element in the lists corresponds to a player. The first list, `positions`, contains strings representing each player's position. The possible positions are: 'GK' (goalkeeper), 'M' (midfield), 'A' (attack) and 'D' (defense). The second list, `heights`, contains integers representing the height of the player in cm. The first player in the lists is a goalkeeper and is pretty tall (191 cm).

You're fairly confident that the median height of goalkeepers is higher than that of other players on the soccer field. Some of your friends don't believe you, so you are determined to show them using the data you received from FIFA and your newly acquired Python skills.

👉 INSTRUCTIONS 100 XP

SCRIPT.PY

```
1 # heights and positions are av
2
3 # Import numpy
4 import numpy as np
5
6 # Convert positions and height
7 np_heights = np.array(heights)
8 np_positions = np.array(positi
9
10 # Heights of the goalkeepers:
11 gk_heights = np_heights[np_pos
12
13 # Heights of the other players
```
